Applicant(s)

KIMURA ET AL.

Examiner

Karla Moore

Art Unit

1763

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --  
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

**Status**

- 1) ☒ Responsive to communication(s) filed on 28 July 2005.  
2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.  
3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

**Disposition of Claims**

- 4) ☒ Claim(s) 1-4 and 6-94 is/are pending in the application.  
4a) Of the above claim(s) 46-61 is/are withdrawn from consideration.  
5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.  
6) ☒ Claim(s) 1-4, 6-45 and 62-94 is/are rejected.  
7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.  
8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

**Application Papers**

- 9) ☐ The specification is objected to by the Examiner.  
10) ☒ The drawing(s) filed on 22 December 2000 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).  
11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

**Priority under 35 U.S.C. § 119**

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).  
a) ☒ All b) ☐ Some \* c) ☐ None of:  
1. ☒ Certified copies of the priority documents have been received.  
2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.  
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).  
\* See the attached detailed Office action for a list of the certified copies not received.

**Attachment(s)**

- 1) ☒ Notice of References Cited (PTO-892)  
2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)  
3) ☐ Information Disclosure Statement(s) (PTO-1449 or PTO/SB/08)  
Paper No(s)/Mail Date \_\_\_\_\_.  
4) ☐ Interview Summary (PTO-413)  
Paper No(s)/Mail Date. \_\_\_\_\_.  
5) ☐ Notice of Informal Patent Application (PTO-152)  
6) ☐ Other: \_\_\_\_\_.

**DETAILED ACTION**

***Claim Rejections - 35 USC § 103***

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary.

Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

3. **Claims 1-4, 6-18, 36, 44, 62, 67, 73-74, 77-78, 89-90 and 93-94 are rejected under 35 U.S.C. 103(a) as being unpatentable over U.S. Patent No. 6,267,853 to Dordi et al. (1) in view of U.S. Patent No. 6,309,981 to Mayer et al. and U.S. Patent No. 6,161,054 to Rosenthal.**

4. Dordi et al. (1) disclose the invention substantially as claimed in Figure 3 and comprising: a semiconductor substrate processing apparatus, comprising: a carry-in and carry-out section (210; column 5, rows 20) for carrying in and carrying out a semiconductor substrate having a surface on which a circuit is formed, the apparatus is capable of carrying in and out in a dry state by using spin/rinse/dry station (212; column 5, row 24); a plated metal film forming unit (240; column 5, rows 41-46) for forming a plated metal film on said semiconductor substrate which has been carried in; a bevel etching unit (one of modules 236; column 9, rows 1-6 and column 19, rows 5-10 and 48-50) for etching a peripheral edge

Art Unit: 1763

portion of said semiconductor substrate; and a transport mechanism (216) for transporting said semiconductor substrate between said units.

5. However, Dordi et al. (1) fail to disclose the apparatus comprising a polishing unit for polishing at least part of said plated metal film on said semiconductor substrate.

6. Mayer et al. disclose using a polishing process after a plated metal film forming process and an edge bevel removal process in a semiconductor manufacturing process for the purpose of planarizing a substrate for further processing (column 5, rows 56-61).

7. It would have been obvious to one of ordinary skill in the art at the time the Applicant's invention was made to have provided a polishing apparatus for use after plating and edge bevel removal processes in Dordi et al. (1) in order to planarize a substrate for further processing as taught by Mayer.

8. Dordi et al. (1) and Mayer et al. disclose the invention substantially as claimed and as described above.

9. However, Dordi et al. (1) and Mayer et al. fail to teach a film thickness measuring station operable to measure a film thickness of said plated metal film formed on said semiconductor substrate in order to adjust plating time or a polishing time; and a recording means for recording results of measurement of the film thickness measured with said film thickness measuring section in order to utilize the recorded data for controlling processing time of a subsequent step and as data for judging a state of each processing step.

10. Rosenthal et al. teach the use of a film thickness measuring station (Figure 2, 22) wherein measurements are recorded and are used to adjust a subsequent processing time for the purpose of enabling the production of higher quality products with tighter specifications at lower cost and with reduced scrap (column 1, row 64 through column 2, row 28; column 3, rows 48-51 and column 6, rows 7-8).

Art Unit: 1763

11. It would have been obvious to one of ordinary skill in the art at the time the Applicant's invention was made to have provided a film thickness measuring station wherein measurements are recorded and used to adjust subsequent processing times in Dordi et al. (1) and Mayer et al. in order to enable the production of higher quality products with tighter specifications at lower cost and with reduced scrap as taught by Rosenthal.

12. With respect to claim 2, the processing apparatus of Dordi et al. (1) may further comprise a cleaning unit for cleaning said semiconductor substrate (one of modules 238; column 9, rows 1-6 and column 19, rows 5-10).

13. With respect to claim 3, the processing apparatus of Dordi et al. (1) may further comprise an annealing unit (211; column 5, row 20) for annealing said semiconductor substrate.

14. With respect to claim 4, said plated metal film forming unit comprises an electroplating unit (column 5, rows 41-46).

15. With respect to claims 7-10, the processing apparatus may further comprise electroless plating cells (215; column 12, rows 20-21) capable of forming a seed layer on said semiconductor substrate or reinforcing a seed layer on a substrate.

16. With respect to claim 11, one of the electroplating units (240) could be used as a reinforcing seed layer forming unit.

17. With respect to claims 12 and 67, Dordi et al. (1) further fail to teach a barrier layer forming unit for forming a barrier layer on said semiconductor substrate.

18. Mayer et al. teach the use of a barrier layer forming process in a semiconductor manufacturing process for the purpose of protecting underlying silicon devices from the diffusion of metal ions (column 5, rows 5-24).

Art Unit: 1763

19. It would have been obvious to one of ordinary skill in the art at the time the Applicant's invention was made to have provided a barrier layer forming unit in Dordi et al. (1) in order to form a barrier layer during a semiconductor manufacturing process so that an underlying silicon device could be protected from the diffusion of metal ions as taught by Mayer et al.

20. With respect to claim 13, one of the electroplating units (240) could be used as a cover plating unit for forming a plated cover layer on said semiconductor substrate.

21. With respect to the language of claims 14-18 that recite duplication of a polishing apparatus, the courts have ruled that the mere duplication of parts has no patentable significance unless a new and unexpected result is produced. In re Harza, 274 F.2d 669, 124 USPQ 378 (CCPA 1960). With respect to the language of claims 14-18 that is drawn to intended uses of the duplicate apparatus the courts have ruled that a claim containing a "recitation with respect to the manner in which a claimed apparatus is intended to be employed does not differentiate the claimed apparatus from a prior art apparatus" if the prior art apparatus teaches all the structural limitations of the claim. Ex parte Masham, 2 USPQ2d 1647 (Bd. Pat. App. & Inter. 1987). Finally with respect to the language of claims 14-18 that refers to the article worked upon in the polishing units the courts have ruled that the inclusion of material or article worked upon by a structure being claimed does not impart patentability to the claims. In re Young, 75 F.2d 966, 25 USPQ 69 (CCPA 1935) (as restated in In re Otto, 312 F.2d 937, 136 USPQ 458, 459 (CCPA 1963)).

22. With respect to claim 36, Dordi et al. (1) disclose the invention substantially as claimed in Figure 3 and comprising: a semiconductor substrate processing apparatus, comprising: a carry-in and carry-out section (210; column 5, rows 20) for carrying in and carrying out a semiconductor substrate having a surface on which a circuit is formed, the apparatus is capable of carrying in and out in a dry state by using spin/rinse/dry station (212; column 5, row 24); a plated metal film forming unit (240; column 5, rows 41-46) for forming a plated metal film on said semiconductor substrate which has been carried in; and a

Art Unit: 1763

transport mechanism (216) for transporting said semiconductor substrate between said units. Treatment in said plated film forming unit is performed with said semiconductor held by a substrate holding portion (Figure 6, 450; column 5, rows 45-47).

23. However, Dordi et al. (1) fail to disclose the apparatus comprising a polishing unit for polishing at least part of said plated metal film on said semiconductor substrate.

24. Mayer et al. disclose using a polishing process after a plated metal film forming process and an edge bevel removal process in a semiconductor manufacturing process for the purpose of planarizing a substrate for further processing (column 5, rows 56-61).

25. It would have been obvious to one of ordinary skill in the art at the time the Applicant's invention was made to have provided a polishing apparatus for use after a plating process in Dordi et al. (1) in order to planarize a substrate for further processing as taught by Mayer. With respect to the different types of treatments performed in the plating metal film forming unit, the courts have ruled that a claim containing a "recitation with respect to the manner in which a claimed apparatus is intended to be employed does not differentiate the claimed apparatus from a prior art apparatus" if the prior art apparatus teaches all the structural limitations of the claim. Ex parte Masham, 2 USPQ2d 1647 (Bd. Pat. App. & Inter. 1987).

26. With respect to claim 44, Dordi et al. (1) disclose the invention substantially as claimed in Figure 3 and comprising: a semiconductor substrate processing apparatus, comprising: a carry-in and carry-out section (210; column 5, rows 20) for carrying in and carrying out a semiconductor substrate having a surface on which a circuit is formed, the apparatus is capable of carrying in and out in a dry state by using spin/rinse/dry station (212; column 5, row 24); a plated metal film forming unit (240; column 5, rows 41-46) for forming a plated metal film on said semiconductor substrate which has been carried in;; and a transport mechanism (216) for transporting said semiconductor substrate between said units. With respect to the process(es) performed in the plated metal film forming unit, depending on the processing material

Art Unit: 1763

supplied (column 21, rows 7-20) any number of processes could be performed. The courts have ruled that a claim containing a “recitation with respect to the manner in which a claimed apparatus is intended to be employed does not differentiate the claimed apparatus from a prior art apparatus” if the prior art apparatus teaches all the structural limitations of the claim. Ex parte Masham, 2 USPQ2d 1647 (Bd. Pat. App. & Inter. 1987). The courts have further ruled that expressions relating the apparatus to contents thereof during an intended operation are of no significance in determining patentability of the apparatus claim. Ex parte Thibault, 164 USPQ 666, 667 (Bd. App. 1969).

27. However, Dordi et al. (1) fail to disclose the apparatus comprising a polishing unit for polishing at least part of said plated metal film on said semiconductor substrate.

28. Mayer et al. disclose using a polishing process after a plated metal film forming process and an edge bevel removal process in a semiconductor manufacturing process for the purpose of planarizing a substrate for further processing (column 5, rows 56-61).

29. It would have been obvious to one of ordinary skill in the art at the time the Applicant’s invention was made to have provided a polishing apparatus for use after plating and edge bevel removal processes in Dordi et al. (1) in order to planarize a substrate for further processing as taught by Mayer.

30. With respect to claims 62 and 67, Dordi et al. (1) and Mayer et al. disclose the apparatus as claimed, which is thoroughly described above.

31. With respect to claims 73-74, 77-78, 89-90 and 93-94, Rosenthal et al. disclose that the sensor is optically integrated which would mean that it is non-contact. This is common in the art as any contact would be a potential source of contamination (column 5, rows 4-8).

32. **Claims 19-26, 45, 75-76 and 91-92 are rejected under 35 U.S.C. 103(a) as being unpatentable over U.S. Patent No. 6,267,853 to Dordi et al. (1) in view of U.S. Patent No. 6,309,981 to Mayer et al. and U.S. Patent No. 5,083,364 to Olbrich et al. and U.S. Patent No. 6,161,054 to Rosenthal.**

33. Dordi et al. (1) disclose the invention substantially as claimed in Figure 3 and comprising: a semiconductor substrate processing apparatus, comprising: a carry-in and carry-out section (210; column 5, rows 20) for carrying in and carrying out a semiconductor substrate having a surface on which a circuit is formed, the apparatus is capable of carrying in and out in a dry state by using spin/rinse/dry station (212; column 5, row 24); a plated metal film forming unit (240; column 5, rows 41-46) for forming a plated metal film on said semiconductor substrate which has been carried in; a bevel etching unit (one of modules 236; column 9, rows 1-6 and column 19, rows 5-10 and 48-50) for etching a peripheral edge portion of said semiconductor substrate; and a transport mechanism (216) for transporting said semiconductor substrate between said units.

34. However, Dordi et al. (1) fail to disclose the apparatus comprising a polishing unit for polishing at least part of said plated metal film on said semiconductor substrate.

35. Mayer et al. disclose using a polishing process after a plated metal film forming process and an edge bevel removal process in a semiconductor manufacturing process for the purpose of planarizing a substrate for further processing (column 5, rows 56-61).

36. It would have been obvious to one of ordinary skill in the art at the time the Applicant's invention was made to have provided a polishing apparatus for use after plating and edge bevel removal processes in Dordi et al. (1) in order to planarize a substrate for further processing as taught by Mayer.

37. Dordi et al. (1) and Mayer et al. disclose the invention substantially as claimed and as described above.

38. However, Dordi et al. (1) and Mayer et al. fail to disclose any of the processing units a interchangeable.

39. Olbrich et al. disclose a multi-chamber semiconductor manufacturing apparatus with interchangeable process module for the purpose of connection modules depending on purpose, thus

Art Unit: 1763

allowing for assembly and modification of the apparatus to meet various needs which leads to increased productivity while reducing the proportionate expense (column 1, rows 27-33 and 46-57).

40. It would have been obvious to one of ordinary skill in the art at the time the Applicant's invention was made to have provided interchangeable modules in Dordi et al. (1) and Mayer et al. in order to connect modules depending on purpose, thus allowing for assembly and modification of the apparatus to meet various needs which leads to increased productivity while reducing the proportionate expense as taught by Olbrich et al.

41. Examiner notes that based on the motivation of Olbrich et al. for providing interchangeable units, it would have been obvious to interchange any of the units on the apparatus.

42. With respect to claims 20-21, 23-24 and 26, the apparatus may further comprise a cleaning unit (one of modules 238; column 9, rows 1-6 and column 19, rows 5-10), an annealing unit (211; column 5, row 20), and a reinforcing seed layer forming unit/seed layer forming unit (215; column 12, rows 20-21), and a cover layer plating unit (240) all of which would be interchangeable, based on the motivation provided by Olbrich et al. described above.

43. With respect to claim 25, Dordi et al. (1) fails to teach a barrier layer forming unit for forming a barrier layer on said semiconductor substrate.

44. Mayer et al. teach the use of a barrier layer forming process in a semiconductor manufacturing process for the purpose of protecting underlying silicon devices from the diffusion of metal ions (column 5, rows 5-24).

45. It would have been obvious to one of ordinary skill in the art at the time the Applicant's invention was made to have provided a barrier layer forming unit in Dordi et al. (1) in order to form a barrier layer during a semiconductor manufacturing process so that an underlying silicon device could be protected from the diffusion of metal ions as taught by Mayer et al.

46. As noted above, based on the motivation of Olbrich et al. for providing interchangeable units, it would have been obvious to interchange any of the units on the apparatus.

Art Unit: 1763

47. With respect to claim 45, in addition to the units mentioned above, the processing apparatus of Dordi et al. (1) may further comprise a cleaning unit for cleaning said semiconductor substrate (one of modules 238; column 9, rows 1-6 and column 19, rows 5-10); an annealing unit (211; column 5, row 20) for annealing said semiconductor substrate; electroless plating cells (215; column 12, rows 20-21) capable of forming a seed layer on said semiconductor substrate or reinforcing a seed layer on a substrate; and a cover plating unit for forming a plated cover layer on said semiconductor substrate. Again, Examiner notes that based on the motivation of Olbrich et al. for providing interchangeable units, it would have been obvious to interchange any of the units on the apparatus.

48. Dordi et al. (1), Mayer et al. and Olbrich et al. disclose the invention substantially as claimed and as described above.

49. However, Dordi et al. (1), Mayer et al. and Olbrich et al. fail to teach a film thickness measuring station operable to measure a film thickness of said plated metal film formed on said semiconductor substrate in order to adjust plating time or a polishing time; and a recording means for recording results of measurement of the film thickness measured with said film thickness measuring section in order to utilize the recorded data for controlling processing time of a subsequent step and as data for judging a state of each processing step.

50. Rosenthal et al. teach the use of a film thickness measuring station (Figure 2, 22) wherein measurements are recorded and are used to adjust a subsequent processing time for the purpose of enabling the production of higher quality products with tighter specifications at lower cost and with reduced scrap (column 1, row 64 through column 2, row 28; column 3, rows 48-51 and column 6, rows 7-8).

51. It would have been obvious to one of ordinary skill in the art at the time the Applicant's invention was made to have provided a film thickness measuring station wherein measurements are recorded and used to adjust subsequent processing times in Dordi et al. (2) and Mayer et al. in order to enable the

Art Unit: 1763

production of higher quality products with tighter specifications at lower cost and with reduced scrap as taught by Rosenthal.

52. With respect to claims 75-76 and 91-92 Rosenthal et al. disclose that the sensor is optically integrated which would mean that it is non-contact. This is common in the art as any contact would be a potential source of contamination (column 5, rows 4-8).

53. **Claims 27 and 31 are rejected under 35 U.S.C. 103(a) as being unpatentable over U.S. Patent No. 6,267,853 to Dordi et al. (1), in view of U.S. Patent No. 6,231,428 to Maloney et al.**

54. Dordi et al. (1) disclose a semiconductor substrate processing apparatus in Figure 3, substantially as claimed and comprising: a carry-in and carry-out section (210; column 5, rows 20) for carrying in and carrying out a semiconductor substrate having a surface on which a circuit is formed, the apparatus is capable of carrying in and out in a dry state by using spin/rinse/dry station (212; column 5, row 24); a plated metal/electroplating film forming unit (240; column 5, rows 41-46) for forming a plated metal film on said semiconductor substrate which has been carried in; a bevel etching unit (one of modules 236; column 9, rows 1-6 and column 19, rows 5-10 and 48-50) for etching a peripheral edge portion of said semiconductor substrate; and a transport mechanism (216) for transporting said semiconductor substrate between said units. The processing apparatus of Dordi et al. (1) may further comprise an annealing unit (211; column 5, row 20) for annealing said semiconductor substrate. The processing apparatus of Dordi et al. (1) may further comprise a cleaning and drying unit for cleaning and drying said semiconductor substrate (one of modules 238; column 9, rows 1-6 and column 19, rows 5-10) and electroless plating cells (215; column 12, rows 20-21) capable of forming a seed layer on said semiconductor substrate or reinforcing a seed layer on a substrate. Further, one of the electroplating units (240) could be used as a cover plating unit for forming a plated cover layer on said semiconductor substrate. The apparatus also comprises a liquid supply equipment having a liquid plating tank (220, column 20, rows 51-59). Dordi et

Art Unit: 1763

al. (1) also teach that different fluids may be provided to the wafer surfaces and that the wafer is also capable of rotation/spin drying (column 8, rows 24-47).

55. Dordi et al. (1) disclose the invention substantially as claimed and as described above.

56. However, Dordi et al. (1) fail to explicitly teach the use of separate handling mechanisms for substrates in wet and dry states.

57. Maloney et al. teach the use of separate handling mechanisms for wafers in wet and dry states for the purpose of using a separate mechanism for dry (clean) wafers (column 19, rows 11-30). This avoids contamination.

58. It would have been obvious to one of ordinary skill in the art at the time the Applicant's invention was made to have provided separate mechanism for wet and dry wafers in Dordi et al. (1) in order to avoid contamination by transferring dry (clean) substrates and wet substrates separately as taught by Maloney et al.

59. With respect to claim 31, treatment in said plated film forming unit is performed with said semiconductor held by a substrate holding portion (Figure 6, 450; column 5, rows 45-47).

60. Additionally, with respect to claim 69 and the process(es) performed in the plated metal film forming unit, depending on the processing material supplied (column 21, rows 7-20) any number of processes could be performed. The courts have ruled that a claim containing a "recitation with respect to the manner in which a claimed apparatus is intended to be employed does not differentiate the claimed apparatus from a prior art apparatus" if the prior art apparatus teaches all the structural limitations of the claim. Ex parte Masham, 2 USPQ2d 1647 (Bd. Pat. App. & Inter. 1987). The courts have further ruled that expressions relating the apparatus to contents thereof during an intended operation are of no significance in determining patentability of the apparatus claim. Ex parte Thibault, 164 USPQ 666, 667 (Bd. App. 1969).

Art Unit: 1763

61. **Claim 28 is rejected under 35 U.S.C. 103(a) as being unpatentable over Dordi et al. (1) and Maloney et al. as applied to claims 27 and 31 and further in view of U.S. Patent No. 5,083,364 to Olbrich et al.**

62. Dordi et al. (1) and Maloney et al. disclose the invention substantially as claimed and as described above.

63. However, Dordi et al. (1) and Maloney et al. fail to disclose said plated metal film forming unit, said bevel etching unit and said annealing unit are interchangeable.

64. Olbrich et al. disclose a multi-chamber semiconductor manufacturing apparatus with interchangeable process module for the purpose of connection modules depending on purpose, thus allowing for assembly and modification of the apparatus to meet various needs which leads to increased productivity while reducing the proportionate expense (column 1, rows 27-33 and 46-57).

65. It would have been obvious to one of ordinary skill in the art at the time the Applicant's invention was made to have provided interchangeable modules in Dordi et al. (1) and Maloney et al. in order to connect modules depending on purpose, thus allowing for assembly and modification of the apparatus to meet various needs which leads to increased productivity while reducing the proportionate expense as taught by Olbrich et al.

66. **Claim 29 is rejected under 35 U.S.C. 103(a) as being unpatentable over Dordi et al. (1) and Maloney et al. as applied to claims 27 and 31 above, in view of U.S. Patent No. 5,310,410 to Begin et al. and U.S. Patent No. 5,083,364 to Olbrich et al.**

67. Dordi et al. (1) and Maloney et al. disclose the invention substantially as claimed and as described above.

Art Unit: 1763

68. However, Dordi et al. (1) and Maloney et al. fail to teach the apparatus may further comprise a film thickness measuring instrument and/or a detection sensor for measuring and/or detecting a film thickness of a film and/or surface state of a film formed on said semiconductor substrate.

69. Begin et al. teach that an inspection unit may be included as part of a cluster apparatus for the purpose of determining whether a substrate or a portion of the apparatus is defective (column 4, rows 48-54).

70. It would have been obvious to one of ordinary skill in the art at the time the Applicant's invention was made to have provided an inspection unit in Dordi et al. (1) and Maloney et al. in order to determine whether a substrate or a portion of the apparatus is defective as taught by Begin et al.

71. Dordi et al. (1), Maloney et al. and Begin et al. disclose the invention substantially as claimed and as described above.

72. However, Dordi et al. (1), Maloney et al. and Begin et al. fail to teach the processing units are interchangeable.

73. Olbrich et al. disclose a multi-chamber semiconductor manufacturing apparatus with interchangeable process module for the purpose of connection modules depending on purpose, thus allowing for assembly and modification of the apparatus to meet various needs which leads to increased productivity while reducing the proportionate expense (column 1, rows 27-33 and 46-57).

74. It would have been obvious to one of ordinary skill in the art at the time the Applicant's invention was made to have provided interchangeable modules in Dordi et al. (1), Maloney et al. and Begin et al. in order to connect modules depending on purpose, thus allowing for assembly and modification of the apparatus to meet various needs which leads to increased productivity while reducing the proportionate expense as taught by Olbrich et al.

Art Unit: 1763

75. **Claim 30 is rejected under 35 U.S.C. 103(a) as being unpatentable over Dordi et al. (1), Maloney et al., Begin et al. and Olbrich et al. as applied to claim 29 above, and further in view of U.S. Patent No. 6,084,419 to Sato et al.**

76. **Dordi et al. (1), Maloney et al., Begin et al. and Olbrich et al.** disclose the invention substantially as claimed and as described above.

77. However, over Dordi et al. (1), Maloney et al., Begin et al. and Olbrich et al. fail to teach said film thickness measuring unit may have an alignment function for said semiconductor substrate.

78. Sato et al. disclose the use of an alignment function for use with an inspection unit (e.g film thickness measuring unit) for the purpose of aligning a substrate with the inspection probes (column 1, rows 26-37).

79. It would have been obvious to one of ordinary skill in the art at the time the Applicant's invention was made to have provided the film thickness measuring unit in Dordi et al. (1), Maloney et al., Begin et al. and Olbrich et al. in order to align a substrate with the inspection probes as taught by Sato et al.

80. **Claims 32-35 are rejected under 35 U.S.C. 103(a) as being unpatentable over Dordi et al. (1) and Maloney et al. as applied to claims 27 and 31 above, in view of U.S. Patent Publication No. 2002/0157960 A1 to Dordi et al. (2).**

81. Dordi et al. (1) and Maloney et al. disclose the invention substantially as claimed and as described above.

82. However, Dordi et al. (1) and Maloney et al. fail to teach said plated film forming unit comprises a substrate holding portion for holding said semiconductor substrate such that a surface to be plated faces upward, an anode disposed above a surface to be plated, a cathode electrode for passing an electric current in contact with said substrate, and performs plating using a plating liquid in a space formed between said surface to be plated and said anode (claim 32). Dordi et al. further fail to teach said plated

Art Unit: 1763

metal film forming unit is capable of raising and lowering said semiconductor substrate so as to correspond to respective operating conditions (claim 33). Nor do Dordi et al. (1) disclose said plated film forming unit is capable sealing said peripheral edge portion of said surface to be plated of said semiconductor wafer in an watertight manner (claim 34) or a pure water supply nozzle capable of simultaneously cleaning said semiconductor substrate and said cathode (claim 35).

83. Dordi et al. (2) disclose an plated film forming unit comprising: a substrate holding portion (Figure 4, 204; paragraph 38) for holding said semiconductor substrate such that a surface to be plated faces upward, an anode (230; paragraph 38) disposed above a surface to be plated, a cathode electrode (210; paragraph 38) for passing an electric current in contact with said substrate, and performs plating using a plating liquid in a space formed between said surface to be plated and said anode. Dordi et al. teach said plated metal film forming unit is capable of raising and lowering (paragraph 75) said semiconductor substrate so as to correspond to respective operating conditions. Dordi et al. (1) disclose said plated film forming unit is capable sealing said peripheral edge portion of said surface to be plated (paragraph 59) of said semiconductor wafer in an watertight manner or a pure water supply nozzle capable of simultaneously cleaning said semiconductor substrate and said cathode. The plated film forming unit is constructed as described for the purpose of constructing a reliable and fast electroplating apparatus capable of delivering uniform power distribution to a substrate surface and capable of providing uniform deposition on a substrate surface (paragraph 13).

84. It would have been obvious to one of ordinary skill in the art at the time the Applicants's invention was made to have provided a plated film forming unit as described above in Dordi et al. (1) and Maloney et al. in order to construct a reliable and fast electroplating apparatus capable of delivering uniform power distribution to a substrate surface and capable of providing uniform deposition on a substrate surface as taught by Dordi et al. (2).

Art Unit: 1763

85. Examiner notes that with respect to the recitations drawn to properties of the processing fluid (e.g. plating liquid impregnated material comprising a water retaining material), the courts have ruled that expressions relating the apparatus to contents thereof during an intended operation are of no significance in determining patentability of the apparatus claim. Ex parte Thibault, 164 USPQ 666, 667 (Bd. App. 1969).

**86. Claims 37-43 and 79-88 are rejected under 35 U.S.C. 103(a) as being unpatentable over U.S. Patent No. 6,267,853 to Dordi et al. (1) in view of U.S. Patent No. 6,309,981 to Mayer et al. and U.S. Patent Publication No. 2002/0157960 A1 to Dordi et al. (2) and U.S. Patent No. 6,161,054 to Rosenthal.**

87. Dordi et al. (1) disclose the invention substantially as claimed in Figure 3 and comprising: a semiconductor substrate processing apparatus, comprising: a carry-in and carry-out section (210; column 5, rows 20) for carrying in and carrying out a semiconductor substrate having a surface on which a circuit is formed, the apparatus is capable of carrying in and out in a dry state by using spin/rinse/dry station (212; column 5, row 24); a plated metal film forming unit (240; column 5, rows 41-46) for forming a plated metal film on said semiconductor substrate which has been carried in;; and a transport mechanism (216) for transporting said semiconductor substrate between said units.

88. However, Dordi et al. (1) fail to disclose the apparatus comprising a polishing unit for polishing at least part of said plated metal film on said semiconductor substrate.

89. Mayer et al. disclose using a polishing process after a plated metal film forming process and an edge bevel removal process in a semiconductor manufacturing process for the purpose of planarizing a substrate for further processing (column 5, rows 56-61).

Art Unit: 1763

90. It would have been obvious to one of ordinary skill in the art at the time the Applicant's invention was made to have provided a polishing apparatus for use after plating and edge bevel removal processes in Dordi et al. (1) in order to planarize a substrate for further processing as taught by Mayer.

91. Dordi et al. (1) and Mayer et al. disclose the invention substantially as claimed.

92. However, Dordi et al. (1) and Mayer et al. fail to teach comprises a substrate holding portion for holding said semiconductor substrate such that a surface to be plated faces upward, an anode disposed above a surface to be plated, a cathode electrode for passing an electric current in contact with said substrate, and performs plating using a plating liquid in a space formed between said surface to be plated and said anode (claim 37). Dordi et al. further fail to teach said plated metal film forming unit is capable of raising and lowering said semiconductor substrate so as to correspond to respective operating conditions (claim 38). Nor do Dordi et al. (1) disclose said plated film forming unit is capable sealing said peripheral edge portion of said surface to be plated of said semiconductor wafer in an watertight manner and formed between said surface to be plated an said anode (claims 39 and 42) or a pure water supply nozzle capable of simultaneously cleaning said semiconductor substrate and said cathode (claim 41).

93. Dordi et al. (2) disclose an plated film forming unit comprising: a substrate holding portion (Figure 4, 204; paragraph 38) for holding said semiconductor substrate such that a surface to be plated faces upward, an anode (230; paragraph 38) disposed above a surface to be plated, a cathode electrode (210; paragraph 38) for passing an electric current in contact with said substrate, and performs plating using a plating liquid in a space formed between said surface to be plated and said anode. Dordi et al. teach said plated metal film forming unit is capable of raising and lowering (paragraph 75) said semiconductor substrate so as to correspond to respective operating conditions. Dordi et al. (1) disclose said plated film forming unit is capable sealing said peripheral edge portion of said surface to be plated (paragraph 59) of said semiconductor wafer in an watertight manner or a pure water supply nozzle

Art Unit: 1763

capable of simultaneously cleaning said semiconductor substrate and said cathode. The plated film forming unit is constructed as described for the purpose of constructing a reliable and fast electroplating apparatus capable of delivering uniform power distribution to a substrate surface and capable of providing uniform deposition on a substrate surface (paragraph 13).

94. It would have been obvious to one of ordinary skill in the art at the time the Applicants's invention was made to have provided a plated film forming unit as described above in Dordi et al. (1) and Mayer et al. in order to construct a reliable and fast electroplating apparatus capable of delivering uniform power distribution to a substrate surface and capable of providing uniform deposition on a substrate surface as taught by Dordi et al. (2).

95. Dordi et al. (1), Mayer et al. and Dordi et al. (2) disclose the invention substantially as claimed and as described above.

96. However, Dordi et al. (1), Mayer et al. and Dordi et al. (2) fail to teach a film thickness measuring station operable to measure a film thickness of said plated metal film formed on said semiconductor substrate in order to adjust plating time or a polishing time; and a recording means for recording results of measurement of the film thickness measured with said film thickness measuring section in order to utilize the recorded data for controlling processing time of a subsequent step and as data for judging a state of each processing step.

97. Rosenthal et al. teach the use of a film thickness measuring station (Figure 2, 22) wherein measurements are recorded and are used to adjust a subsequent processing time for the purpose of enabling the production of higher quality products with tighter specifications at lower cost and with reduced scrap (column 1, row 64 through column 2, row 28; column 3, rows 48-51 and column 6, rows 7-8).

98. It would have been obvious to one of ordinary skill in the art at the time the Applicant's invention was made to have provided a film thickness measuring station wherein measurements are recorded and

Art Unit: 1763

used to adjust subsequent processing times in Dordi et al. (1), Mayer et al. and Dordi et al. (2) in order to enable the production of higher quality products with tighter specifications at lower cost and with reduced scrap as taught by Rosenthal.

99. Examiner notes that with respect to the recitations drawn to properties of the processing fluid (e.g. plating liquid impregnated material comprising a water retaining material), the courts have ruled that expressions relating the apparatus to contents thereof during an intended operation are of no significance in determining patentability of the apparatus claim. Ex parte Thibault, 164 USPQ 666, 667 (Bd. App. 1969).

100. With respect to claims 79-88, Rosenthal et al. disclose that the sensor is optically integrated which would mean that it is non-contact. This is common in the art as any contact would be a potential source of contamination (column 5, rows 4-8).

101. **Claims 63 and 71 are rejected under 35 U.S.C. 103(a) as being unpatentable over U.S. Patent No. 6,267,853 to Dordi et al. (1) in view of U.S. Patent No. 6,161,054 to Rosenthal.**

102. Dordi et al. (1) disclose a semiconductor substrate processing apparatus substantially as claimed in Figure 3, comprising: a carry-in and carry-out section (210; column 5, rows 20) for carrying in and carrying out a semiconductor substrate having a surface on which a circuit is formed, the apparatus is capable of carrying in and out in a dry state by using spin/rinse/dry station (212; column 5, row 24); a plated metal film forming unit (240; column 5, rows 41-46) for forming a plated metal film on said semiconductor substrate which has been carried in; an annealing unit (211; column 5, row 20) for annealing said semiconductor substrate; and a transport mechanism (216) for transporting said semiconductor substrate between said units. The processing apparatus of Dordi et al. (1) may further comprise a cleaning unit for cleaning said semiconductor substrate (one of modules 238; column 9, rows 1-6 and column 19, rows 5-10); and a liquid supply equipment (220; column 20, rows 51-64) having a

Art Unit: 1763

plating liquid tank. Dordi et al. (1) also teach that different fluids may be provided to the wafer surfaces and that the wafer is also capable of rotation/spin drying (column 8, rows 24-47).

103. However, Dordi et al. (1) fail to teach the apparatus may further comprise a film thickness measuring instrument and/or a detection sensor for measuring and/or detecting a film thickness of a film and/or surface state of a film formed on said semiconductor substrate.

104. However, Dordi et al. (1) fail to teach a film thickness measuring station operable to measure a film thickness of said plated metal film formed on said semiconductor substrate in order to adjust plating time or a polishing time; and a recording means for recording results of measurement of the film thickness measured with said film thickness measuring section in order to utilize the recorded data for controlling processing time of a subsequent step and as data for judging a state of each processing step.

105. Rosenthal et al. teach the use of a film thickness measuring station (Figure 2, 22) wherein measurements are recorded and are used to adjust a subsequent processing time for the purpose of enabling the production of higher quality products with tighter specifications at lower cost and with reduced scrap (column 1, row 64 through column 2, row 28; column 3, rows 48-51 and column 6, rows 7-8).

106. It would have been obvious to one of ordinary skill in the art at the time the Applicant's invention was made to have provided a film thickness measuring station wherein measurements are recorded and used to adjust subsequent processing times in Dordi et al. (1) in order to enable the production of higher quality products with tighter specifications at lower cost and with reduced scrap as taught by Rosenthal.

107. With respect to claim 71, the courts have ruled that The mere duplication of parts has no patentable significance unless a new and unexpected result is produced. In re Harza, 274 F.2d 669, 124 USPQ 378 (CCPA 1960). The courts have also ruled that the mere rearrangement of parts which does not modify the operation of a device is prima facie obvious. In re Japikse, 181 F.2d 1019, 86 USPQ 70 (CCPA 1950). In re Kuhle, 526 F.2d 553, 188 USPQ 7 (CCPA 1975).

108. **Claims 64 and 65 are rejected under 35 U.S.C. 103(a) as being unpatentable over U.S. Patent No. 6,267,853 to Dordi et al. (1) in view of U.S. Patent No. 6,161,054 to Rosenthal and U.S. Patent No. 6,368,183 to Trojan et al.**

109. Dordi et al. (1) disclose a semiconductor substrate processing apparatus substantially as claimed in Figure 3, comprising: a carry-in and carry-out section (210; column 5, rows 20) for carrying in and carrying out a semiconductor substrate having a surface on which a circuit is formed, the apparatus is capable of carrying in and out in a dry state by using spin/rinse/dry station (212; column 5, row 24); a plated metal film forming unit (240; column 5, rows 41-46) for forming a plated metal film on said semiconductor substrate which has been carried in; an annealing unit (211; column 5, row 20) for annealing said semiconductor substrate; and a transport mechanism (216) for transporting said semiconductor substrate between said units. The processing apparatus of Dordi et al. (1) may further comprise a cleaning unit for cleaning said semiconductor substrate (one of modules 238; column 9, rows 1-6 and column 19, rows 5-10); and a liquid supply equipment (220; column 20, rows 51-64) having a plating liquid tank. Dordi et al. (1) also teach that different fluids may be provided to the wafer surfaces and that the wafer is also capable of rotation/spin drying (column 8, rows 24-47).

110. However, Dordi et al. (1) fail to teach the apparatus may further comprise a film thickness measuring instrument and/or a detection sensor for measuring and/or detecting a film thickness of a film and/or surface state of a film formed on said semiconductor substrate.

111. However, Dordi et al. (1) fail to teach a film thickness measuring station operable to measure a film thickness of said plated metal film formed on said semiconductor substrate in order to adjust plating time or a polishing time; and a recording means for recording results of measurement of the film thickness measured with said film thickness measuring section in order to utilize the recorded data for controlling processing time of a subsequent step and as data for judging a state of each processing step.

Art Unit: 1763

112. Rosenthal et al. teach the use of a film thickness measuring station (Figure 2, 22) wherein measurements are recorded and are used to adjust a subsequent processing time for the purpose of enabling the production of higher quality products with tighter specifications at lower cost and with reduced scrap (column 1, row 64 through column 2, row 28; column 3, rows 48-51 and column 6, rows 7-8).

113. It would have been obvious to one of ordinary skill in the art at the time the Applicant's invention was made to have provided a film thickness measuring station wherein measurements are recorded and used to adjust subsequent processing times in Dordi et al. (1) in order to enable the production of higher quality products with tighter specifications at lower cost and with reduced scrap as taught by Rosenthal.

114. Dordi et al. (1) and Rosenthal disclose the invention substantially as claimed and as described above.

115. However, Dordi et al. (1) and Rosenthal fail to teach the cleaning unit having rolls for scrub-cleaning.

116. Trojan et al. disclose the use of rolls in cleaning apparatus for the purpose of scrub cleaning a substrate in a solution (column 2, rows 28-33).

117. It would have been obvious to one of ordinary skill in the art at the time the Applicant's invention was made to have provided scrub rolls in the cleaning apparatus of Dordi et al. (1) and Rosenthal. in order to scrub clean substrates as taught by Trojan et al.

118. **Claims 69, 70 and 72 are rejected under 35 U.S.C. 103(a) as being unpatentable over Dordi et al. (1) and Maloney et al. as applied to claims 27 and 31 above, in view of U.S. Patent Publication No. 2002/0157960 A1 to Dordi et al. (2).**

119. Dordi et al. (1) disclose the invention substantially as claimed in Figure 3 and comprising: a semiconductor substrate processing apparatus, comprising: a carry-in and carry-out section (210; column 5, rows 20) for carrying in and carrying out a semiconductor substrate having a surface on which a circuit

Art Unit: 1763

is formed, the apparatus is capable of carrying in and out in a dry state by using spin/rinse/dry station (212; column 5, row 24); a plated metal film forming unit (240; column 5, rows 41-46) for forming a plated metal film on said semiconductor substrate which has been carried in; a bevel etching unit (one of modules 236; column 9, rows 1-6 and column 19, rows 5-10 and 48-50) for etching a peripheral edge portion of said semiconductor substrate; and a transport mechanism (216) for transporting said semiconductor substrate between said units.

120. However, Dordi et al. (1). fail to teach said plated film forming unit comprises a substrate holding portion for holding said semiconductor substrate such that a surface to be plated faces upward, an anode disposed above a surface to be plated, a cathode electrode for passing an electric current in contact with said substrate, and performs plating using a plating liquid in a space formed between said surface to be plated and said anode (claim 32). Dordi et al. further fail to teach said plated metal film forming unit is capable of raising and lowering said semiconductor substrate so as to correspond to respective operating conditions (claim 33). Nor do Dordi et al. (1) disclose said plated film forming unit is capable sealing said peripheral edge portion of said surface to be plated of said semiconductor wafer in an watertight manner (claim 34) or a pure water supply nozzle capable of simultaneously cleaning said semiconductor substrate and said cathode (claim 35).

121. Dordi et al. (2) disclose an plated film forming unit comprising: a substrate holding portion (Figure 4, 204; paragraph 38) for holding said semiconductor substrate such that a surface to be plated faces upward, an anode (230; paragraph 38) disposed above a surface to be plated, a cathode electrode (210; paragraph 38) for passing an electric current in contact with said substrate, and performs plating using a plating liquid in a space formed between said surface to be plated and said anode. Dordi et al. teach said plated metal film forming unit is capable of raising and lowering (paragraph 75) said semiconductor substrate so as to correspond to respective operating conditions. Dordi et al. (1) disclose said plated film forming unit is capable sealing said peripheral edge portion of said surface to be plated

Art Unit: 1763

(paragraph 59) of said semiconductor wafer in an watertight manner or a pure water supply nozzle capable of simultaneously cleaning said semiconductor substrate and said cathode. The plated film forming unit is constructed as described for the purpose of constructing a reliable and fast electroplating apparatus capable of delivering uniform power distribution to a substrate surface and capable of providing uniform deposition on a substrate surface (paragraph 13).

122. It would have been obvious to one of ordinary skill in the art at the time the Applicants's invention was made to have provided a plated film forming unit as described above in Dordi et al. (1) in order to construct a reliable and fast electroplating apparatus capable of delivering uniform power distribution to a substrate surface and capable of providing uniform deposition on a substrate surface as taught by Dordi et al. (2).

123. Examiner notes that with respect to the recitations drawn to properties of the processing fluid (e.g. plating liquid impregnated material comprising a water retaining material), the courts have ruled that expressions relating the apparatus to contents thereof during an intended operation are of no significance in determining patentability of the apparatus claim. Ex parte Thibault, 164 USPQ 666, 667 (Bd. App. 1969).

### ***Response to Arguments***

39. Applicant's arguments with respect to claims 1-4, 6-45 and 62-94 have been considered but are moot in view of the new ground(s) of rejection.

### ***Conclusion***

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Karla Moore whose telephone number is 571.272.1440. The examiner can normally be reached on Monday-Friday, 9:00 am-6:00 pm.

Art Unit: 1763

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Parviz Hassanzadeh can be reached on 571.272.1435. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>.
